

Recitation # 2 Regions Between Curves

Group work:

Problem 1 Consider the region bounded by the curves $y = 7x^2 - 12$ and $y = x^2 - 6x$.

(a) Draw a sketch of the graphs.

Solution: Set the curves equal to each other to find the intersection points:

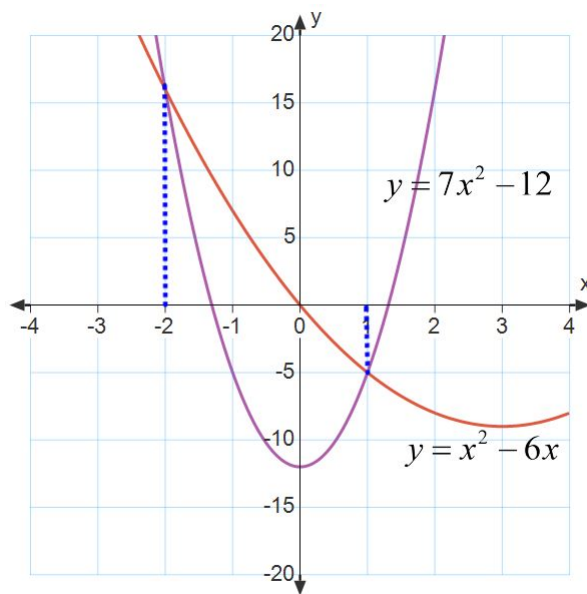

$$7x^2 - 12 = x^2 - 6x$$

$$6x^2 + 6x - 12 = 0$$

$$6(x^2 + x - 2) = 0$$

$$6(x - 1)(x + 2) = 0$$

$$x = 1 \text{ or } x = -2$$

Learning outcomes:

Recitation # 2 Regions Between Curves

- (b) Find the area between these curves.

Solution: By the solution to part (a), we know that these two curves intersect at $x = -2, 1$. By checking the point $x = 0$ (or by looking at the graph from part (a)) we see that $y = 7x^2 - 12 \leq y = x^2 - 6x$ on the interval $[-2, 1]$. Said another way, $y = 7x^2 - 12$ is on top and $y = x^2 - 6x$ is on bottom on the interval $[-2, 1]$, and we will use "top - bottom" to find the area between the curves. So the area between the curves is:

$$\begin{aligned} \int_{-2}^1 (x^2 - 6x) - (7x^2 - 12) dx &= \int_{-2}^1 (-6x^2 - 6x + 12) dx \\ &= \left[-2x^3 - 3x^2 + 12x \right]_{-2}^1 \\ &= (-2(1) - 3(1) + 12(1)) - (-2(-2)^3 - 3(-2)^2 + 12(-2)) \\ &= 7 - (-20) = 27 \end{aligned}$$

- (c) Find the area of the region bounded by the curves $x = 7y^2 - 12$ and $x = y^2 - 6y$.

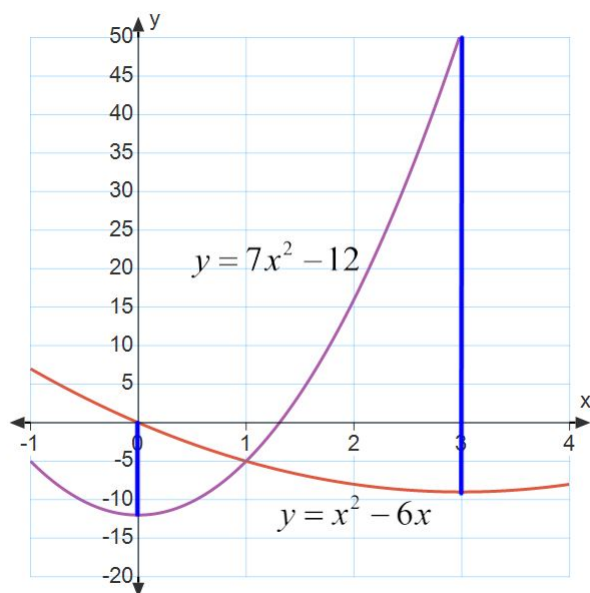

Solution: This region is exactly the same as the region from part (a), except it is rotated clockwise by 90° . Since the area of a region does not change under rotation, we have that the area of the new region is still 27.

- (d) Find the area of the region bounded by the curves $y = 7x^2$ and $y = x^2 - 6x + 12$.

Solution: The region bounded by the curves $y = 7x^2$ and $y = x^2 - 6x + 12$ is just the region in part (a) translated upward by 12 units. Since the area of a region does not change under translation, we have that the area of the new region is still 27.

- (e) Find the area of the region bounded by the curves $y = 7x^2 - 12$, $y = x^2 - 6x$, $x = 0$, and $x = 3$.

Recitation # 2 Regions Between Curves

Solution:

□ We already know that the graphs of the two functions intersect at the point $x = 1$. By checking the points $x = 0$ and $x = 3$ (or by looking at the graph above) we see that

$$y = x^2 - 6x \geq y = 7x^2 - 12 \quad \text{on} \quad [0, 1]$$

$$y = 7x^2 - 12 \geq y = x^2 - 6x \quad \text{on} \quad [1, 3]$$

Thus, the area between the curves is

$$\begin{aligned} & \int_0^1 (x^2 - 6x) - (7x^2 - 12) dx + \int_1^3 (7x^2 - 12) - (x^2 - 6x) dx \\ &= \int_0^1 (-6x^2 - 6x + 12) dx + \int_1^3 (6x^2 + 6x - 12) dx \\ &= \left[-2x^3 - 3x^2 + 12x \right]_0^1 + \left[2x^3 + 3x^2 - 12x \right]_1^3 \\ &= [(-2 - 3 + 12) - 0] + [(2(27) + 3(9) - 12(3)) - (2 + 3 - 12)] \\ &= 7 + 54 + 27 - 36 + 7 = 59 \end{aligned}$$

Recitation # 2 Regions Between Curves

Problem 2 Set up two different integrals that compute the area of the region bounded by the curves $x = y^2$ and $y = 6 - x$ (and be sure to draw a sketch of the graphs).

Solution: *In terms of y :*

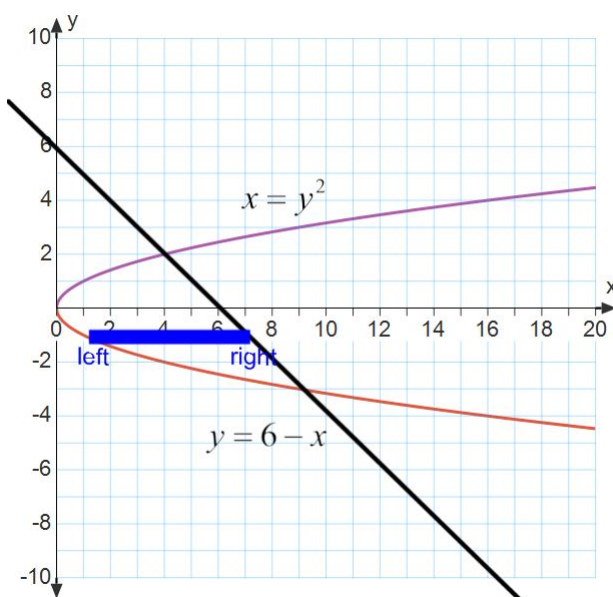

First we find the intersection points:

$$y^2 = 6 - y$$

$$y^2 + y - 6 = 0$$

$$(y + 3)(y - 2) = 0$$

$$y = -3 \text{ or } y = 2$$

Thus,

$$\text{Area of region} = \int_{-3}^2 [(6 - y) - y^2] dy.$$

In terms of x :

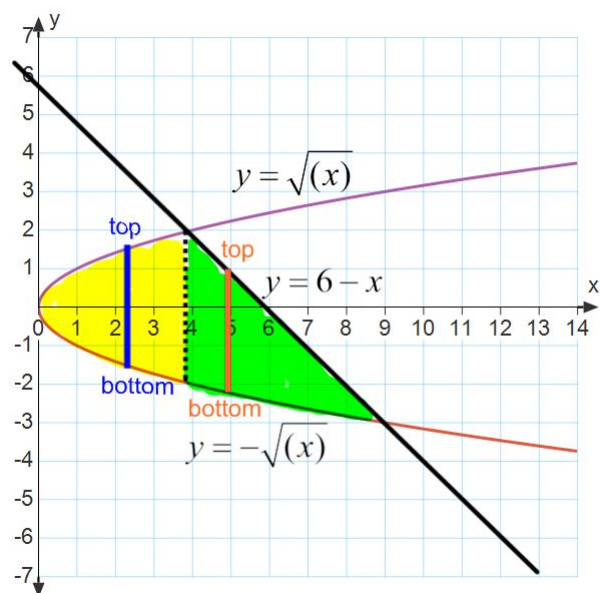

We need to rewrite $x = y^2$ as the two functions $y = \sqrt{x}$ and $y = -\sqrt{x}$. Then, we need two integrals because the top function changes where $y = \sqrt{x}$ intersects $y = 6 - x$. We also need to find our intersection points in terms of x . Since we already know the y -values of the points, we can plug the y -values into either function to get the x -values:

$$x = 6 - y$$

$$x(2) = 6 - 2 = 4$$

$$x(-3) = 6 - (-3) = 9$$

Recitation # 2 Regions Between Curves

Thus,

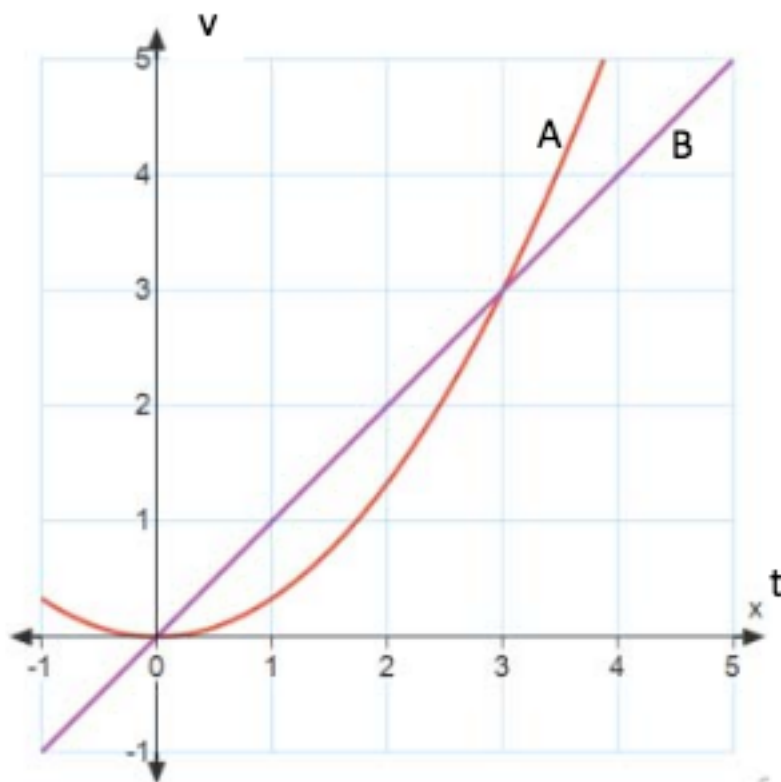

$$\text{Area of region} = \int_0^4 (\sqrt{x} - (-\sqrt{x})) dx + \int_4^9 ((6 - x) - (-\sqrt{x})) dx.$$

Recitation # 2 Regions Between Curves

Problem 3 Two runners (A and B) run in a race in which the winner runs the farthest in 4 minutes. The runners' respective velocities are

$$v_A(t) = \frac{1}{3}t^2 \quad v_B(t) = t$$

The graphs of the runners' velocities is given below.

- (a) Who is running the fastest 2 minutes into the race?

Solution: $v_A(2) = \frac{4}{3}$ and $v_B(2) = 2$. So B is running faster at the 2 minute mark of the race.

- (b) Who is winning the race 2 minutes into the race (and by how much)?

Solution: The distance that A covers in the first 2 minutes is

$$\int_0^2 v_A(t) dt = \int_0^2 \frac{1}{3}t^2 dt = \left[\frac{1}{9}t^3 \right]_0^2 = \frac{8}{9}.$$

Recitation # 2 Regions Between Curves

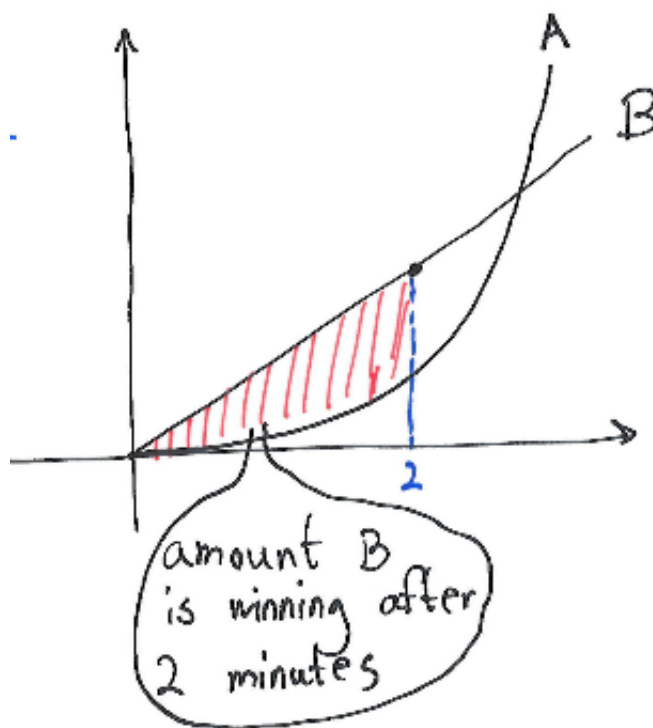

The distance that B covers in the first 2 minutes is

$$\int_0^2 v_B(t) dt = \int_0^2 t dt = \left[\frac{1}{2}t^2 \right]_0^2 = 2.$$

So B is winning after 2 minutes.

B is winning by $2 - \frac{8}{9} = \frac{10}{9}$. This could also be calculated by

$$\int_0^2 (v_B(t) - v_A(t)) dt.$$

(c) What special event occurs 3 minutes into the race?

Solution: Runner A matches runner B 's velocity. ie, $v_A(3) = v_B(3)$.

(d) Who wins the race (and by how much)?

Solution: The distance that A covers is

$$\int_0^4 v_A(t) dt = \int_0^4 \frac{1}{3}t^2 dt = \left[\frac{1}{9}t^3 \right]_0^4 = \frac{64}{9} = 7.\bar{1}.$$

Recitation # 2 Regions Between Curves

The distance that B covers is

$$\int_0^4 v_B(t) dt = \int_0^4 t dt = \left[\frac{1}{2}t^2 \right]_0^4 = 8.$$

So runner B wins. The amount that B wins by is

$$8 - \frac{64}{9} = \frac{8}{9}.$$

This could have also been computed by

$$\int_0^4 (v_B(t) - v_A(t)) dt.$$
