Recitation #19: Approximating functions with polynomials - Solutions

Warm up:

For each of the following, write the given polynomial in summation notation starting with $k = 0$.

(a) $\dfrac{3x}{2} - \dfrac{5x^2}{3} + \dfrac{7x^3}{4} - \dfrac{9x^4}{5} + \dfrac{11x^5}{6}$

(b) $\dfrac{1}{2}x + \dfrac{1 \cdot 5}{4 \cdot 2!}x^3 + \dfrac{1 \cdot 5 \cdot 9}{8 \cdot 3!}x^5 - \dfrac{1 \cdot 5 \cdot 9 \cdot 13}{16 \cdot 4!}x^7$

(c) $(x-1)^3 - \dfrac{(x-1)^4}{2!} + \dfrac{(x-1)^5}{4!} - \dfrac{(x-1)^6}{6!}$

Solution: (a) $\displaystyle\sum_{k=0}^{4} (-1)^k (2k+3) \frac{x^{k+1}}{k+2}$.

(b) $\displaystyle\sum_{k=0}^{3} \frac{1 \cdot 5 \cdot \ldots \cdot (4k+1)}{2^{k+1}(k+1)!} x^{2k+1}$.

(c) $\displaystyle\sum_{k=0}^{3} \frac{(-1)^k}{(2k)!}(x-1)^{k+3}$.

Group work:

Problem 1 *Assuming that the function $f(x)$ is infinitely differentiable, and given that*

$$f(x) = f(a) + \frac{f'(a)}{1!}(x-a)^1 + \frac{f''(a)}{2!}(x-a)^2 + \frac{f'''(a)}{3!}(x-a)^3 + c_4(x-a)^4 + \frac{f^{(5)}(a)}{5!}(x-a)^5$$

show that the coefficient c_4 of the $(x-a)^4$ term in the Taylor polynomial is $\dfrac{f^{(4)}(a)}{4!}$.

Learning outcomes:

Solution: *Notice that we have the following:*

$$f'(x) = f'(a) + f''(a)(x-a) + \frac{f^{(3)}(a)}{2}(x-a)^2 + 4c_4(x-a)^3 + \frac{f^{(5)}(a)}{4!}(x-a)^4$$
$$f''(x) = f''(a) + f^{(3)}(a)(x-a) + 4 \cdot 3c_4(x-a)^2 + \frac{f^{(5)}(a)}{3!}(x-a)^3$$
$$f^{(3)}(x) = f^{(3)}(a) + 4 \cdot 3 \cdot 2c_4(x-a) + \frac{f^{(5)}(a)}{2}(x-a)^2$$
$$f^{(4)}(x) = 4! \cdot c_4 + f^{(5)}(a)(x-a)$$
$$f^{(4)}(a) = 4! \cdot c_4 + 0$$
$$\implies \quad \boxed{c_4 = \frac{f^{(4)}(a)}{4!}}.$$

Problem 2 *Let $f(x) = \sin(2x)$. Find $p_3(x)$ about the point $a = \frac{\pi}{8}$.*

Solution: *First, note that around a*

$$p_3(x) = f(a) + f'(a)(x-a) + \frac{f''(a)}{2}(x-a)^2 + \frac{f^{(3)}(a)}{3!}(x-a)^3.$$

So we compute

$$f'(x) = 2\cos(2x) \quad \implies \quad f'\left(\frac{\pi}{8}\right) = \sqrt{2}$$
$$f''(x) = -4\sin(2x) \quad \implies \quad f''\left(\frac{\pi}{8}\right) = -2\sqrt{2}$$
$$f^{(3)}(x) = -8\cos(2x) \quad \implies \quad f^{(3)}\left(\frac{\pi}{8}\right) = -4\sqrt{2}.$$

Therefore

$$\boxed{p_3(x) = \frac{\sqrt{2}}{2} + \sqrt{2}\left(x - \frac{\pi}{8}\right) - \sqrt{2}\left(x - \frac{\pi}{8}\right)^2 - \frac{2\sqrt{2}}{3}\left(x - \frac{\pi}{8}\right)^3}.$$

Problem 3 *Let $f(x) = xe^{-x}$ on the interval $[-2, 8]$.*

(a) *Write the Taylor polynomial $p_4(x)$ around $a = 3$.*

$$\text{Fun facts: } f'(x) = -e^{-x}(x-1)$$
$$f''(x) = e^{-x}(x-2)$$
$$f^{(3)}(x) = -e^{-x}(x-3)$$
$$f^{(4)}(x) = e^{-x}(x-4)$$

(b) *Write $p_4(x)$ about $a = 3$ in summation notation. Also, write the remainder term $R_4(x)$.*

(c) *Calculate $p_4(4.5)$ and, using $R_4(4.5)$, estimate how close $p_4(4.5)$ is to $f(4.5)$. Do the same for $p_4(1.5)$.*

(d) *Use the remainder term $R_4(x)$ to estimate the maximum error for $p_4(x)$ on $[-2, 8]$.*

(e) *How large must n be to assure that the n^{th} degree Taylor polynomial for $f(x) = xe^{-x}$ about $a = 3$ approximates $2e^{-2}$ within 10^{-5}?*

Solution: (a)

$$\begin{aligned} p_4(x) &= f(a) + f'(a)(x-a) + \frac{f''(a)}{2!}(x-a)^2 + \frac{f^{(3)}}{3!}(x-a)^3 + \frac{f^{(4)}}{4!}(x-a)^4 \\ &= 3e^{-3} - 2e^{-3}(x-3) + \frac{e^{-3}}{2}(x-3)^2 - \frac{e^{-3}}{4!}(x-3)^4. \end{aligned}$$

(b)

$$p_4(x) = \sum_{k=0}^{4} \frac{(-1)^k e^{-3}(3-k)}{k!}(x-3)^k.$$

$$R_4(x) = f(x) - p_4(x) = \frac{f^{(5)}(c)}{5!}(x-3)^5 = \frac{-e^{-c}(c-5)}{5!}(x-3)^5$$

for some c between x and 3.
